

Including an Interface (Example "ICmpEventCallback")

Requirement

- Create a "Standard project" and select *CODESYS Control Win V3* as the device.
- Define the target system by means of the *Network scan*.

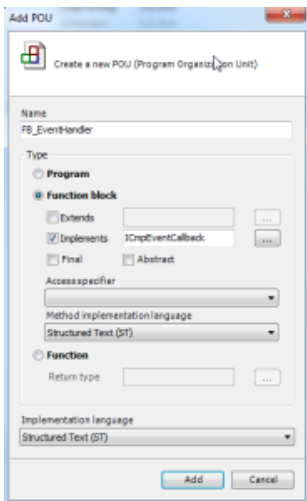

- Open the *Library Manager* and add the following libraries:
CmpApp
CmpEventMgr
StringUtils
SysTypes2 Interfaces

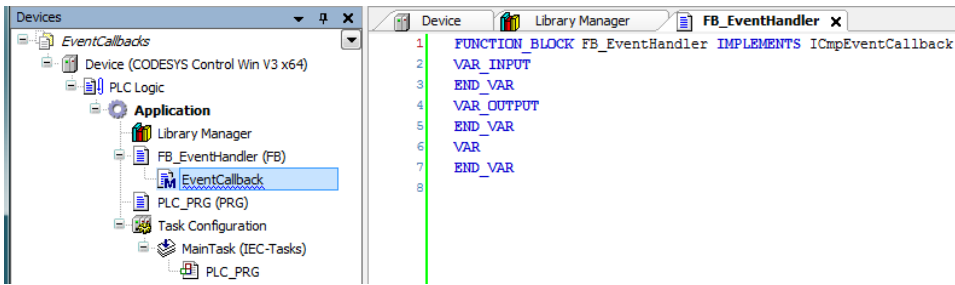

Creating the EventHandler

- Create a new FB named *FB_EventHandler* and implement the interface *CmpEventMgr.ICmpEventCallback*.

The method *EventCallback* is created automatically with the FB:

- Add the following variables to the *FB_EventHandler*:

Declaration

```

FUNCTION_BLOCK FB_EventHandler IMPLEMENTS ICmpEventCallback
VAR_OUTPUT
    udiStartDone      : UDINT;
    udiStopDone       : UDINT;
    udiLogin           : UDINT;
END_VAR
VAR
    hEventStart       : SysTypes.RTS_IEC_HANDLE;
    hEventStop        : SysTypes.RTS_IEC_HANDLE;
    hInterfaceStart    : SysTypes.RTS_IEC_HANDLE;
    hInterfaceStop     : SysTypes.RTS_IEC_HANDLE;
    iecResult          : SysTypes.RTS_IEC_RESULT;
    itfEvtCallback    : CmpEventMgr.ICmpEventCallback;
    hEventLogin        : SysTypes.RTS_IEC_HANDLE;
    hInterfaceLogin    : SysTypes.RTS_IEC_HANDLE;
    _dwStopReason      : DWORD;
    _sAppName          : STRING;
END_VAR

```

- Adapt the method *EventCallback* as follows:

Declaration

```

METHOD EventCallback : CmpEventMgr.RTS_IEC_RESULT
VAR_INPUT
    (*Pointer to the event parameters, see Struct EventParam*)
    pEventParam : POINTER TO CmpEventMgr.EventParam;
END_VAR
VAR
    pStartParam : POINTER TO EVTPARAM_CmpApp;
    pStopParam  : POINTER TO EVTPARAM_CmpAppStop;
    pLoginParam : POINTER TO EVTPARAM_CmpAppComm;
END_VAR

```

Implemen
tation

```

CASE pEventParam^.EventId OF
  CmpApp.EventIDs.EVT_StartDone:
    pStartParam := pEventParam^.pParameter;
    IF pStartParam <> 0 THEN
      StrCpyA(ADR(_sAppName), sizeof(_sAppName), ADR(pStartParam^.pApp^.szName));
    END_IF
    udiStartDone := udiStartDone + 1;
  CmpApp.EventIDs.EVT_PrepareStop:
    pStopParam := pEventParam^.pParameter;
    IF pStopParam <> 0 THEN
      _dwStopReason := pStopParam^.ulStopReason;
    END_IF
    udiStopDone := udiStopDone + 1;
  CmpApp.EventIDs.EVT_Login:
    pLoginParam := pEventParam^.pParameter;
    udiLogin := udiLogin + 1;
END_CASE

```

- Add the method *FB_Init* to the *FB_EventHandler* and adapt the code as follows:

Declaration

```

METHOD FB_Init: BOOL
VAR_INPUT
  bInitRetains: BOOL; // TRUE: the retain variables are initialized (reset warm / reset cold)
  bInCopyCode : BOOL; // TRUE: the instance will be copied to the copy code afterward (online
change)
END_VAR

```

Implemen tation

```

itfEvtCallback := This^;
hEventStart := EventOpen(CmpApp.EventIds.EVT_StartDone, CmpApp.EventIds.CMPID_CmpApp, iecResult);
hEventStop := EventOpen(CmpApp.EventIds.EVT_PrepareStop, CmpApp.EventIds.CMPID_CmpApp, iecResult);
hEventLogin := EventOpen(CmpApp.EventIds.EVT_Login , CmpApp.EventIds.CMPID_CmpApp, iecResult);

hInterfaceStart := EventRegisterCallback(hEventStart, itfEvtCallback, iecResult);
hInterfaceStop := EventRegisterCallback(hEventStop, itfEvtCallback, iecResult);
hInterfaceLogin := EventRegisterCallback(hEventLogin, itfEvtCallback, iecResult);

```

- Add the method *FB_Exit* to the *FB_EventHandler* and adapt the code as follows:

Declaration

```

METHOD FB_Exit: BOOL
VAR_INPUT
  bInCopyCode: BOOL; // TRUE: the exit method is called in order to leave the instance which
will be copied afterwards (online change).
END_VAR

```

Implemen tation

```

EventUnregisterCallback(hEventStart, hInterfaceStart);
EventUnregisterCallback(hEventStop, hInterfaceStop);
EventUnregisterCallback(hEventLogin, hInterfaceStop);
EventClose2(hEventStart);
EventClose2(hEventStop);
EventClose2(hEventLogin);

```

Instantiating the event handler and test the functionality

- Adapt the POU `PLC_PRG` as follows:

Declaration

```

VAR
    udiCntStart      : UDINT;
    udiCntStop       : UDINT;
    udiCntLogin      : UDINT;
    fbEventHandler   : FB_EventHandler;
END_VAR

```

Implementation

```

fbEventHandler(udiStartDone => udiCntStart, udiStopDone => udiCntStop, udiLogin => udiCntLogin);

```

- Download the project to the controller and start it.
When logging in/out and starting the project, the counters are incremented.

The screenshot shows the SIMATIC Manager interface with the variable declaration and implementation for the `PLC_PRG` program. The variable declaration is as follows:

```

VAR
    udiCntStart      : UDINT;
    udiCntStop       : UDINT;
    udiCntLogin      : UDINT;
    fbEventHandler   : FB_EventHandler;
END_VAR

```

The implementation is:

```

fbEventHandler(udiStartDone => udiCntStart, udiStopDone => udiCntStop, udiLogin => udiCntLogin);

```

The variable declaration table is as follows:

Expression	Type	Value	Prepared value	Address	Comment
udiCntStart	UDINT	1			
udiCntStop	UDINT	0			
udiCntLogin	UDINT	1			
fbEventHandler	FB_EventHandler				
udiStartDone	UDINT	1			
udiStopDone	UDINT	0			
udiLogin	UDINT	1			
hEventStart	POINTER TO BYTE	16#000000001...			
hEventStop	POINTER TO BYTE	16#000000001...			
hInterfaceStart	POINTER TO BYTE	16#000000140...			
hInterfaceStop	POINTER TO BYTE	16#000000140...			
hResult	UDINT	0			
hEventCallback	Conflicting JObj...	16#000000001...			
hEventLogin	POINTER TO BYTE	16#000000002...			
hInterfaceLogin	POINTER TO BYTE	16#000000140...			
udiStopReason	DWORD	0			
_sAppname	STRING	Application
